

Commodity Outlook 2024

Commodity Outlook 2024 — Sample edition

Agricultural Commodity Outlook — 2024

Page: 1

Headline outlook

The 2024 outlook points to easing global food prices relative to the 2022 peak, tempered by tighter supplies of rice and soft commodities. Wheat fundamentals are balanced, maize supplies remain ample, and weather risk in the southern hemisphere is the principal upside risk to prices.

Demand and stocks

Global import demand is expected to normalize after two years of precautionary stocking. Ending stocks of major grains are projected to recover to comfortable levels, which should keep price movements range-bound unless production disruptions materialize.

Risks

Key risks include El Niño impacts on Asian and Australian crops, further restrictions on exports from major suppliers, and elevated energy input costs. Downside risks to demand include a slower-than-expected recovery in emerging economies.
