Rice Market Report — Sample edition

Global Rice Market Report — 2023 Review

Page: 1

Executive Summary

International rice quotations averaged \$625 per tonne in 2023, influenced above all by India's export restrictions, tightening inventories in major exporters, and firm demand from West Africa and the Middle East.

What factors influence rice prices?

Rice prices are shaped by policy measures in exporting countries, notably export bans and minimum export prices; by monsoon outcomes in key growing regions; by government procurement programs; and by freight and energy costs. Currency movements against the US dollar also matter because most quotations are dollar-denominated. In 2023, the primary driver was the Indian export ban on non-basmati white rice, which redirected demand toward Thai and Vietnamese origins and lifted quotations across the board.

Traditional vs non-traditional exporters

Thailand and Vietnam expanded shipments to fill the gap, while Cambodia and Pakistan gained market share. Import-dependent countries such as Indonesia and the Philippines restocked aggressively, sustaining upward pressure on prices through mid-2024 before harvests improved.

Terminology: Export ban

An export ban is a government measure that restricts the volume of a commodity shipped abroad. Producers of the banning country typically benefit from lower domestic prices, while importing countries face higher world prices as supply tightens.
